

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

where there are differences of pronunciation among the Indians. In such cases we have sought for the pure Seneca in contradistinction from the *idioms of Mohawk, Cayuga, Onondaga*, etc., and for Seneca as spoken by the old men."

With these facts in view, I cannot accept Dr. Beauchamp's use of the *r*-sound in his orthography *ka-when-tah* for *kă-whe'-tă*.

29. THE JACKSON MEDALS. — In 1874 or 1875 a farmer brought to this city and sold to Mr. W. H. Daum a silver medal which his boys found in a stone tumulus, supposed to be the grave of Little Bear, an Osage chief. The medal is three inches in diameter, has on its face the profile of Jackson, with the words, "Andrew Jackson, President of the United States, A.D. 1829," and on the reverse a pipe and a tomahawk crossed, two hands clasped, — one that of an Indian, and the other of the President, — and the words "peace and friendship." Can you or any of the readers of *Science* tell me why these medals were given to the Indians, and whether the practice is a common one?

26. THE EARTH'S ROTATION AS AFFECTING RAILWAY-TRAINS. — Mr. Goodridge will find a partial answer to his query, in 'The Annual Report of the Chief Signal Officer for 1885,' Part II., which forms W. Ferrel's 'Recent Advances in Meteorology,' p. 191. After having shown that a body moving in any direction on the earth's surface is deflected, and giving the formulas for computing the deflecting force, the example is treated, "If a railroad-train on the parallel of 45° runs at the rate of forty miles per hour, what would be the lateral pressure per ton of the weight of the train on the side of the rails if both were on the same level?" and the answer is given that it would be 0.38 of a pound per ton of two thousand pounds. In reply to this query, a writer in *Engineering News* quotes the famous 'Bär's law' regarding deflection of rivers. Ferrel's formula shows that the action of the earth's rotation is not at all confined to a body moving in the direction of the meridian, as this writer also assumes. Ferrel gives an example of this kind, and finds that a river one mile in width, flowing in latitude 45° at the rate of four miles per hour, will be 1.2 inches higher at the right-hand bank than at the left-hand bank.

21. GLOBULAR LIGHTNING. — Apropos of this subject, let me mention three cases which have come to my knowledge in such a way as to inspire confidence in them. The first in order of time occurred about 1859 or 1860, and was witnessed by a lady, the wife of a prominent physician. She was lying down for an after-dinner nap one summer day. From her letter I quote what seems pertinent: "The experience was this, and at The Forest Grove House, Schooley's Mountains. . . . We were aroused by a sudden and quite heavy hail-storm. . . . I immediately went to the open window, putting it down, leaving just space enough to put out my hands, in which I enjoyed the fun of catching the stones to eat. . . . This was only for a few minutes, when we were terribly startled by a flash of lightning and a peal of thunder, and I saw what appeared to be a ball of fire the size of my head come down the body of a tree about three yards from my hands. . . . The flash, the thunder, and the ball seemed simultaneous. . . . The tree did not afterward show the usual appearance of being struck, except just at the roots, where the ground was torn up for quite a little distance. . . . The house was struck at the same time and set on fire at the roof, but at its farthest point from us. . . . I was the only one who saw the ball of fire, but I have never doubted that I really did see it. . . . It was too plainly before my very eyes." The second case occurred a few miles north of Lambertville, N.J., in July, 1879. A barn was burned, and the company which had insured it instituted an investigation to determine the cause of the fire. From the testimony, I quote that of two men who swore that they saw "a cylindrical form of fire, apparently about three feet in diameter, and from six to eight feet in length, fall with a whizzing sound. . . .

No thunder was heard, nor did any rain fall at that time. . . . Others also saw the strange occurrence." These men were in Pennsylvania, across the Delaware River, about a mile from the spot where the barn was burned. The third case was at Connersville, Ind., in August of 1881. Mr. L. L. Broaddus wrote me that it was about twenty minutes before four in the morning when the family and several neighbors were roused by a terrific crash. One of the neighbors, living nearly half a mile away, slept in a room from which she could see the Broaddus mansion. She saw a bolt strike a tree and burst like a bomb, scattering fire-balls over the yard, and brilliantly illuminating the premises. Mr. W. H. Broaddus and his wife slept on the side of the house where the tree was, and saw the 'second act'; that is, the fire-balls rolling about. They say the phenomenon lasted long enough for them to collect themselves and call occupants of other rooms, who, however, did not arrive in time to witness the display. The duration of the phenomenon was estimated by those who saw it at about a minute.

21. GLOBULAR LIGHTNING. — It may throw further light upon this interesting phenomenon to quote several additional reports received by the United States Hydrographic Office from masters of vessels; and, by permission of the hydrographer, I have selected the following as likely to be of interest in this connection. The phenomenon seems to be by no means unusual at sea, and perhaps some readers of *Science* who have devoted special attention to the study of electricity will contribute new facts or suggestions which may lead to a satisfactory explanation. The instances already cited (*Science*, x. p. 324, xi. pp. 38, 62), with those given below, would seem to furnish a very good basis upon which to build a theory. A further discussion will also be valuable as indicating, possibly, certain important details of observation which have hitherto been neglected, but which it might be practicable to attend to, even on shipboard. Captain Moore, British steamship 'Siberian,' in addition to the report already given, states that he encountered a severe electric storm Jan. 17, 1887, latitude $42^\circ 50'$ north, longitude $59^\circ 14'$ west; dark, gloomy weather, with rain and sleet. Between 8 and 9 P.M., during shift of wind from south-west to south-east, a brilliant display of St. Elmo's fire was observed, taking the shape of balls of fire shooting up from the horizon all around the vessel, and bursting at an altitude of about 5° . One ball, showing a green light, was mistaken for a vessel's side-light; brilliant lightning to the south-west. Captain Bowers, American bark 'Hannah McLoon,' encountered a severe electric storm Feb. 27, 1887, latitude $37^\circ 17'$ north, longitude $73^\circ 56'$ west, during a stormy gale from the south-west; all points and all wire rigging brilliantly illumined; fire-balls flying in the air. Captain Mitchell, British steamship 'Mentmore,' experienced a succession of terrific hurricanes from west-north-west during a voyage from Liverpool to Baltimore. Jan. 28, 1885, at 2.30 A.M., a ball of St. Elmo's fire fell between the bridge and foremast, and afterwards played upon the foremast and gaff. This ball of fire was so bright that for a time it blinded the officer on watch. Captain McKinnon, British brig 'Nellie Crosby,' encountered a remarkably severe electric storm Nov. 30, 1886, off Minot's Ledge light, Massachusetts, with terrific thunder and blinding lightning. A ball burst between the masts, completely blinding all on board; heavy rain; sea full of phosphorescence. Captain Sparks, American bark 'John H. Pierson,' reports witnessing an unusual phenomenon during a hurricane, Aug. 25, 1886, between the hours of 9 and 11 P.M. The sky was completely overcast, the weather dark and gloomy, and rain falling heavily. In the northern horizon, balls of fire were seen to shoot upwards, reaching an elevation of at least 30° , and covering a horizontal angle of at least 20° . The display continued at frequent intervals during the time mentioned. Captain Bodden, British schooner 'Clara L. Dyer,' reports that on Sept. 20, 1887, when in the Gulf of Mexico, about two hundred miles south by east from South Pass, had very heavy rain-squalls with thunder and lightning. The effect of the lightning was very peculiar, as it seemed to issue from the waves instead of from the heavens; thought at first it was due to the phosphorescence of the water, but the flashes seemed too plainly marked for that.

EVERETT HAYDEN.

U.S. Hydrographic Office, Feb. 20.
